

What is AURA?

Banks lose **\$487 billion every year** to fraud and bad loans. The reason? Two separate teams — credit and fraud — never talk to each other. AURA fixes this by combining both into **one intelligent system**.

● The Problem

Credit Team asks: "Can they repay?"

Uses old-fashioned models. Checks income and collateral. Updates once every few months.

Fraud Team asks: "Will they repay?"

Uses fast AI. Watches every transaction. Updates in milliseconds.

⚡ **THE GAP** — Where these two teams meet is where **\$487B in losses disappear every year**

💡 The Big Idea

Credit default and fraud are actually **the same thing** — just seen through different time windows. A loan that defaults after 18 months? That's slow-motion fraud. A stolen card used for 30 seconds? That's fast-motion credit loss. **AURA watches both windows at once.**

● The Solution — 4 Simple Pieces

1 One Brain

One AI model that understands both credit risk AND fraud — instead of two separate models that never share notes.

2 Your Digital Twin

A "doppelgänger" for each customer that predicts their normal behaviour. When reality diverges — alert.

3 Time Telescopes

Looks at the same person through two time windows: seconds (fraud) and months (credit). Catches what neither team sees alone.

4 Self-Attacking System

AI agents constantly attack the system in shadow mode — like a immune system training itself against new threats.

Think of it like this: Right now, banks have a doctor for your heart and a separate doctor for your lungs — but neither talks to the other. AURA is like having **one specialist who sees the whole body** and catches problems before they become emergencies.

20–30%

LESS BAD LOANS

40–50%

LESS FRAUD

\$50–80M

SAVED PER YEAR

The Bottom Line

AURA makes one smart system that catches both credit problems and fraud — saving banks billions. It starts free for 90 days, and only gets paid when it works.
